1. 発明の名称

離目なし頻管の穿孔⇒よび拡管用芯金合金 2. 特許的求の範囲

1. 爪量ででが 0.1 ないし 0.2 5 %、 Cr が 1 ないし 3 %、 NI が 1 ないし 9 %、 Mo かよびW のいずれか 1 程または 2 種合計で 0.3 ないし 3 %、 Co が 1 ないし 2 %、 TI かよび 2r のいずれか 1 種もしくは 2 種合計が 0.2 ないし 0.5 %、 数部 Fo かよび不可避的な 数量不純物からなり、 且つ NI/Cr の重量比の値が 1 か 5 3 である昨日なし頻繁穿孔かよび拡管用合金。

2 さらに必要れ応じて脱酸剤として 81が重 量で 1.5 多以下、 Ma が 1.5 多以下の何れかまた は両者を含有することを特徴とする特許請求の 額別動1 項配級の芯金合金。

3.発明心脈細な敗明

この発射は中央丸型側片から戦目なし側置を 製造する際に用いられる穿孔および拡管用芯金 形成のための合金材料に関するものであって、 特級昭 5 9 - 1 1 8 9 9 号 (特別昭 60 -号) 発明になる合金をさらに改良したものであ

上配先出版明報書にも記載されているように、一般に推目なし個智穿孔用の芯金は、傾斜圧能ロールによって回転かよび前進する、かよそ1200でに加熱された中央丸形倒片に微方向に圧入されて、とれによって側智の動方向の穿孔が行われる。またとのようにして穿孔された側管は、同様に傾斜圧延ロールによって回転かよび前進する拡管用の別の芯金が、かよそ1000でに加熱された側管の穿孔内に圧入されることによって、その拡管が行われる。

その結果、非孔かよび拡管用の芯金の装面に 高温かよび高圧力が作用して、芯金の製面には 単純、芯金材の単性変動によるしわ、部分的な 溶融損傷、あるいは管材との焼付きによるかじ りや割れが発生し、これらによって起る芯金の 変形かよび損傷が進行して、比較的短便用固数 のうちに芯金の増命が進きてその使用が不可能 ¿ \$ \$.

第孔用(または拡製用) 芯金の表面に生する これらの損傷を防止するために、芯金を形成す る合金に要求される特性は損傷の種類によって 次のように異なる。

(I) 以紙およびしわの発生防止のためには、 合金の高額及にかける根據的製品が高いことが 必要である。

(2) 制れ発生防止のためには、常盤にかける 合金の機械的強度と伸展性が高いことが必要で ある。

(3) 部分的な財政担似の発生防止のためには、 芯金合金の組成のうち、地金への移解度の小さい合金元素の前加をできるだけ少なくして、観 関制新や粒界析出によってとれらの合金元素が 粒界に出析して、部分的な販点低下かよび粒界 酸化の生ずるととも防止することが必要である。

(4) 続付きによるかじりや割れの発生を防止 するためには、スケール付け処理によって、芯 金の表面に断熱性と負責性とを有する触形なス ケールが適度の厚さK形成されるととが必要で ある。

既述の特職的59-11899号発明の目的は、地金への存解度が少なく、粒界場がして部分的な溶解機器の原因となること、スケール付け処理の順に形成されるスケール増をあくするCrとをできるだけ少なくし、Ni。MoシェびWの固溶体硬化により常温かよび高温度にかける機械的強度を高めることによって、耐用度が従来のものよりも特象に優れた穿孔用芯金を得ることにもった。

との目的は、重量ででが 0.1 ないし 0.2 5 多、Cr が 1 ないし 3 多、NI が 1 ないし 9 多、 Mo かよび W のい ずれか 1 独もしくは 2 独合計で 0.3 ないし 3 多、 技部が Po かよび不可避的な 扱景不純物からなり、且つ NI/Cr の倉量比の値が 1 ないし 3 の組成を有する合金を用いることによって達成された。

本発明の目的は、上記特減昭 5 9 - 1 1 8 9 9 号発明の合金をさらに改良して、穿孔用芯金の

耐用皮をさらに向上させ得るような合金を得る ととにある。

この目的は、上記既発明にかける合金の成分 組成のものに、さらに重量でで。をi ないしょが、 Ca をi ないしょが、かよび Ti かよび Zr のいずれ か i 補もしくは 2 値の合計を Q. 2 ないし Q. 5 が の制合で追加級加することによって建成された。

なか、射粉既出劇発明の場合と同様に、上記の本発明にかける合金組成のものに、必要に応じて通常の脱散剤として 1.5 %以下の 61、6 しくは 1.5 %以下の Ma、あるいはこの両者をさらに追加級加し得るものとする。

次に、本発明になる合金にかける各成分の組成処別民定理由について、特額的59-11899 号 別避労かよび関節にかける記述と一部重複させながら戦明をする。

Cは、地金に図得し、あるいは図得限以上のCは熱処理によって様々な類様を示すととによって、合金の常真シよび高温での機械的強度を向上させるので、合金の強度向上に乗り有効な

元素である。しかしながら、Cがわまり多くなると、とくにCrと共存する場合には、Crの次化物が粒界に折出して粒界能化をひき起したり、またこの嵌化物はMoやWを地会よりもよく固層数収するので、MoやWの抵加による地金の固層強化効果を載するなどの逆効果をも併せて持つものである。

本発明になる芯金用合金は、ご金の部分的な特徴情を防止する見地から、従来のことははのことが、常識が出まれている。 これの こう有量はできるにいかが いっこう でいっしんが のません こう でいっしん がいい ない という でいい という でんしょう でいい という でんしょう でいい という でんしょう でんしょう でんしょう でんしょう はんしょう はんしょう はんしょう はんしょう とれば かいしょう はんしょう という はんしょう という はんしょう はんしょく はんしょく はんしょう はんしょく はんしん はんしょく はんしょく はんしんしん はんしん はんしょく はんしん はんしんしんしんしょく はんしんしんしんしんしんしんしんしんしんしんしんしんしんしんしんしん

本発明になる芯金用合金においては、C含有量の下級値は、上記の経済性と前途性との観点 ·

科局項60-208458(3)

からとれず 0.1 がとし、上限値は穿孔用芯金の配分的部切防止の観点からとれを 0.2 5 がとした。

81 は、一般の脱版剤として、合金の脱版調整用に必要に応じて合金に添加されるが、 81 が 多過ぎると合金の個性が低下するとともに、 穿孔用芯金の表面に断熱性と胸帯性を有する緻密なスケールを付着させるために施される一般のスケール付け処理時に、 スケール中にファイヤライト (FeU-8102)を生成してスケールを影響にする。

よって BI 含有量の上限値を 1.5 % 化定めた。 下限については別に制限はない。

Ma 4 一般の脱酸剤 として、合金の脱酸調整用 K必要化応じて合金K協加される。そして Ma が多遊ると 81 の場合と同様にスケールを散料に する。

よって Ma 含有量の上製 似を 1.5 がと足めた。 下限については別に制限はない。

Cr および NI の成分範囲機定理由については、

両成分の比較が度要であるので、両者をまとめ て説明をする。

Cr はぬ金に固然し、あるいはCと結合して設化物を形成して、常識あるいは高温度における機械的強度を高めるとともに、合金の耐取化性を向上させるのに有効な元素である。然しながらCr 含布量が高すさると、耐酸化性が向性と同常性と同常性と同常性と同常性との表面に断熱性と同常性としているスケールを付着させる一般のクラールが関くなり、既述の芯金に生ずる損傷のうち、はいずとの続けらによるかじりが多発する。またCr 含布量が低くすぎると、常識および高温度における合金の機械的強度が低下し、芯金に強度不足による庫耗、しつ、あるいは割れが発生する。

NI はCと説化物を形成することなく地変化全部問荷して、固複体硬化によって常温かよび高温皮にかける機械的強度を高めるのに有効な元素である。然しながら、NI は Cr に比べて高低であるので、NI だけで常温かよび高温度にかける

合金の機械的強度を高めるとコスト高となり、またで、と共存する場合ほどには高い機械的強度は初られない。また、NIの添加は、Cr添加の場合に比べて、スケール付け処理による付着スケール板が再くなる条告ははるかに少ない。

及って、芯金合金ドナ分を常温かよび高級底における根域的強度、かよび適度な厚さのスケール間を与え、さらド合金に経済性を特たせるために、スケール層を減くすることなく機械的 強度を高めることのできるNIを主体とし、これ に許许し初る範囲のCrを参加して、常温かよび 高温度にかける機械的強度を補完するとともに、 NI が加強を軽載することにした。

上版の見地から、スケール層の取さを移くしないために Cr 含有似の上限を3 %とし、下限は 競技的対比を補充するためにこれを1 %とした。 また N1 は投資的強度を高めるために、その含量 を Cr 含分別の1 倍から3 倍、すなわち N1/Cr の 取断比の値を1 ないし3 と定めた。

NI/Cr 比の飢を1ないしると足めた根拠を訴

1 図かよび餌2 図の1 組の曲線図、ならびに乳3 図かよび第4 図の1 組の曲線図を用いて設明する。第1 図は Cr 含有量が1.4 %の場合の常温にかける合金の機械的強度に及ぼす NI/Cr 比の影響を示す曲線図、第2 図は同温度 9 0 0 ℃にかける同様の影響曲線図、第3 図は Cr 含有量が2.8 %の場合の常温にかける同様の影響曲線図、第4 図は同温度 9 0 0 ℃にかける同様の影響曲線図である。

これらの曲線図から判るように、穿孔用芯金の耐用度の低下をもたらす損傷の一つである割れを防止するのに必要な常識の引張強さが45ないし6.0 kg/m² であって強度不足であり、Ni/Cr 比が3以上では伸び率が楽しく低下して割れの助止には不適当である。また損傷の他の一つであるだ金表面の摩託なよびしわを防止するために必要な高温度になける引張強さは、Ni/Cr 比が3以上では5.2 ないし5.3 kg/m² となっていて強度不足であるとともに、伸び率が等しく低 下するのが刊る。

以上の結果から刊前して、本発明になる芯金合金中のNI/Cr 比の値を1 ないし3 の範囲で選ぶことに定めた。

Mo かよびWは合金地金に関密し、あるいはでき続合して炭化物を形成して、とくに合金の高温及にかける機械的領度を高めるのに有効な元素である。反面、Mo かよびW 含有量の増加はスケール付け処理により芯金製面に生成付着である。本発明になるご金合金の高温及機械的性質に及ぼす Mo かよびW 新加の影響の例が能 5 図に示されている。 この歯殻図は Cr 含有型が 2 8 多、NI/Cr 比が 2 0 の場合、鉄酸温及が 9 0 0 での場合。Mo、W・または MoとWの台削量の変化が、合金の引張り強さかよび伸び罪に及ぼす影響を示するのである。

との曲脳図によると、Mo かよびWの何れか1 独もしくは2種合計の終加量が0.2 ぎまでは高 離引張り強さの向上に効果がない。しかしなが 5、との終加針が0.3 ぎから1.5 ぎまでは数加 量の増加とともに引張り強さは緩やかに増加し、 添加量が 1.5 から 2 0 ぎまででは引張り強さは 添加量の増加とともに象徴に増加する。そして 2 0 ぎ以上の添加では引張り強さは内び緩やか な増加に転ずるのを見ることができる。

本発明合金によって製作された恋金によって
1200で近傍に加熱された中央丸形倒片を穿孔
する場合に、穿孔される側片の材質が単なる改 紫剣であるならば、Mo かよびWのいずれか1 復 もしくは2 値合計の添加量が1.5 多以下の本発 別合金による穿孔用芯金で十分に従来の芯金の 耐用度を上退るととができる。しかしながら、 穿孔される側片の材質が1.3 多タロム倒もしく は2.4 多タロム側のような特殊側である場合に は、Mo かよびWの何れか1 種もしくは2 複合計 の添加量は1.5 多から3.0 多までであるととが 必要である。

従って、本発明になる合金における Mo および W のいずれか 1 種もしくは 2 種合計の森加量は、 とれを 0.3 ないし 3 % と定めた。

Co 以一般の炭素鋼、 もしくは本見明になる芯金白金のような低合金側に抵加される元素のうちで、側の競人性を低下させる唯一の元素である。

穿孔用芯金は、1200℃近傍に加熱された中 実丸形備片中に圧入されるので、穿孔道板の穿 孔用芯金の長面置度は1200℃から1300℃近 傍に、表面から約5 m内部では800℃近傍に、 そしてさらに内部では700℃以下の温度となる。

とのようを状態に加熱された忠金は、穿孔頂 使に樹水によって常器にまで冷却されたのち、 再び新たな側片中に圧入され、とうして加熱を よび冷却が綺恵される。との練返しによってか 会の表面に部かい亀甲状の創れが生じて、 が被穿孔パイプの内面に圧延値を発生させるも のである。との亀甲状の創れは主として加熱冷 のである。との亀甲状の創れは主として加熱冷 のである。との亀甲状の創れは主として加熱冷

一般に換入性が低く、換入変態のない場合の 倒体の熱応力は、関体の表面では圧縮応力が、 例体の中心部では引銀応力が発生する。とれに 対して、焼入性が高く、焼入変態が生ずる場合の倒体の熱応力は、その表面では引援応力が、その中心部では圧縮応力が発生する。すなわら両者の場合に熱応力の分布が逆転するのである。そして、一般に表面が圧都応力となる絶入変態のない加熱冷却の繰返しの方が亀甲割れの発生が少ない。

焼入性の大小は、丸御側片を水焼入れしたのち、その断面硬度を測定し、硬度がロックウェルでスケール4の以上になる硬化層の厚さると丸棒の半径rとの比率 d/rを以てこれを扱わすことができる。すなわち d/r値が小さくなる程焼入性が低下するととを表わす。

本発明合金による半径 2.5 mの丸御を水焼入れした場合の d/r値に及ぼす Co 放分含有量の影響の一例が終 6 図の曲線図に示されている。 C の 自解図から、 Co が 1.75 s t では焼入性の低下が取著であるが、 Co が 1.75 s を超えるとその効果が少ないととが判る。

よって本発明合金の Co 数加量の下限は、能入

持南昭60-208458(5)

性低下の効果の見地から19とし、上限は、経 咳的にコスト高となる割には焼入性低下の効果 があまり得られない見地からとれを29とした。

Cu は地金中に数細に折出して、常温の引張強さを高めるのに有効な元素である。また既述した断熱性と潤有性とを有するスケール付けの処理の際に、スケール返下の地金中に富化されて、スケールの地金への密着性を改善するのにも有効な元素である。しかしながら、抵加量が1 手以下では常温の引張強さの向上は少なく、低加量が多過ぎると、スケール度下に富化されたCuが高温度で地金の結晶粒界に及調して、芯金の表情部を観力にする。

よって本祭明合金における Ca の葯加量下級を 1 %とし、上限を 2 % とした。

Ti および Zr は Cr よりも優先して C と結合して 次化物を形成する。そして Ti および Zr の 以化物は Cr の 次化物とはちがって、 地会中 K 均一 K 分散するとと、 および 高温度 K おける地会中への 的 解放が Cr の 次化物 K 比べて 紙 めて 小さい

ととから、粒界の部分的な融点低下かよび粒界の能化を軽減するとともに、高温度にかける引張強さを高めるのに有効な元素である。さらに、Cr よりも優先して炭化物を形成するのでCr の段化物量が減少する結果、Cr 炭化物中に吸収されるCr 、WかよびMo が減少し、従ってとれらの元素の地金中の濃度があくなって、固治体硬化によって合金の高温度にかける引張強さが向上する。しかしながら、Ti かよび Zr の能加量が多過ぎると、合金を大気中で溶解する場合に、著しく溶粉の成動性が減ぜられ、芯金製作の際に偽造性を害するととになる。

以上、難目なし側管の穿孔用芯金合金ドついて述べたが、阿拡管用芯金合金ドついても会く 穿孔用芯金合金と同様であるからその説明を省略する。

次に実施例について説明をする。

本発射になる穿孔用芯金合金の実施制例の組成を約1表に示す。 約1表には先発明である特額的59-11899号発明になる合金、シよび従来公知のこの復合金の組成をも併配してある。

別1 表に示された組成の各合金を素材として、JIS - 2 - 2201 の規定による 1 0 号常温引張試験片、 JIS-G-0567 号の規定による高温度引張試験片、 および直径が 6 9 m/m、7 2 m/m、かよび 7 5 m/m のアツセルミル用撃孔芯金をそれぞれ設作した。 高温度引張り試験は温度 9 0 0 でで 砂分5 5 の歪速度でおとなわれた。 とれらのごとを用いて、 実際に JIS の BUJ 2 値(C 約 1 5、CT 約 1.5)のペアリング網材(いわゆる高次素クロム輪受け解材)をアツセルミルを用いて定れている。 花金の耐用度は穿孔用芯金 1 倒当りの半均毀孔本数で扱わされている。

記2 表に見られるように、本発明になる合金 の常都かよび高温度にかける機械的強度は、従 来公知のこの複合金の1.5倍ないし3倍、特別 配59-1.1899号発明合金のそれらとはほ 理同等もしくは無ちか大きいことが判る。そし て、本発明合金で製作された芯金の前用度は、 公知の合金のものの2ないし5倍、特別配59 -11899号発明合金のものの1.5ないし2 倍となっているのを見る。との本発明合金による を放加による芯金表面の亀甲割れの減少、Cu系加 によるスケールの哲療、TIシェび Zr の添加に よる以化物の数界個析防止の結効果によるもの である。

SPECIFICATIONS

1. Title of the Invention

Core Metal Alloy for Piercing or Expanding Seamless Steel Pipe

2. Scope of Patent Claims

- 1. A core metal alloy for piercing or expanding [insertion] a [end insertion] seamless steel pipe made from, by weight, 0.1 to 0.25% C, 1 to 3% Cr, 1 to 9% Ni, 0.3 to 3% of a total of one or two types of Mo and W, 1 to 2% of Co, 1 to 2% of Cu, 0.2 to 0.5% of a total of one or two types of Ti and Zr, and the balance Fe with inevitable trace quantities of impurities, and a weight ratio value for Ni/Cr of between 1 and 3.
- 2. A core metal alloy recited in Claim 1 characterized by the fact of further containing, by weight, according to need 1.5% or less of Si and/or 1.5% or less of Mn and as a deoxidizer.

3. Detailed Description of the Invention

The present invention relates to an alloy material for forming a core metal for piercing or expansion when manufacturing seamless steel pipes from solid round billets, and further improves the alloy in the Patent Application S59-11899 [i.e., 1984-11899] (Unexamined Patent Application Gazette Number S60 [i.e., 1985]) invention.

As recited in the Specification of the aforementioned antedated application, generally, a core metal for piercing a seamless metal pipe is pressed lengthwise by a solid round steel billet heated to approximately 1200°C that advances and rotates due to an oblique rolling roll, and piercing is thereby made in the axial direction of the steel pipe. A pierced steel pipe pierced in this manner can be expanded

by a separate core metal for expansion that advances and rotates similarly due to an oblique rolling roll being pressed in the pierce hole of the steel pipe heated to approximately 1000°C.

As a result, high temperature and a high stress act on the surface of the core metal for piercing or expansion, abrasion on the surface of the core metal, wrinkling due to plastic flow of the core metal material, partial melting damage, or galling or cracks due to seizures with the pipe material occur, deformation or damage to the core metal occurring thereby proceed, the life with the number of uses of the core metal is comparatively shortened, and the use becomes impossible.

The properties demanded of an alloy to form a core metal in order to prevent such damage that occurs on the surface of core metal for piercing (or expansion) differ as follows according to the type of damage.

- (1) In order to prevent the occurrence of abrasion or wrinkling, the mechanical strength of the alloy needs to be high at high temperatures.
- (2) In order to prevent the occurrence of cracks, the mechanical strength and extensibility of the alloy need to be high at ordinary temperatures.
- (3) In order to prevent the occurrence of partial melting damage, it is necessary to prevent partial lowering of the melting point and grain boundary embrittlement from occurring by adding as few alloy elements with a low melting point to the bare metal as possible in the composition of the core metal alloy, and segregating these alloy elements by grain boundary using solidification segregation and grain boundary separation.
- (4) In order to prevent the occurrence of galling and cracks due to seizures, a fine scale needs to be formed with an appropriate thickness having thermal insulation and lubrication on the surface of the core metal due to scale attachment.

The object of the Patent Application Number S59-11899 [i.e., 1984-11899] invention described above was to obtain a core metal for piercing markedly superior in duration compared to conventional core metals by increasing the mechanical strength and ordinary and high temperatures using solid solution hardening of Ni, Mo and W, grain boundary segregating and decreasing as much as possible the quantity of C which is a cause of partial solution damage and the quantity of Cr which thins the scale layer formed during scale attachment, and decreasing the solubility in the bare metal.

This object was achieved using an alloy having, by weight, {A}¹ 0.1 to 0.25% C, 1 to 3% Cr, 1 to 9% Ni, 0.3 to 3% of a total of one or two types of Mo and W, and the balance Fe with inevitable trace quantities of impurities, and a composition with a weight ratio value for Ni/Cr of between 1 and 3.

The object of the present invention is to further improve the alloy in the aforementioned Patent Application Number S59-11899 [i.e., 1984-11899] invention, and obtain an alloy for piercing whose durability is further improved.

This object was achieved by adding to the component composition of the alloy of the aforementioned invention additives in a ratio of, by weight, 1 to 2% Co, 1 to 2% Cu, and 0.2 to 0.5% of a total of one or two types of Ti and Zr.

Similar to the aforementioned antedated application invention, the additives of either 1.5% or less of Si and 1.5% or less or Mn or both may be added as ordinary deoxidizers according to need to the alloy composition of the present invention mentioned above.

Next is a description, which duplicates some of the above description, of the Specification and Drawings of Patent Application Number S59-11899 [i.e., 1984-11899] for the range limitations of the composition of each component in an alloy of the present invention.

C is an effective element for improving the strength of an alloy because it increases the mechanical strength of alloys at ordinary and high temperatures by exhibiting various aspects when C is melted in bare metal or undergoes heat treatment above the solution point. However, if there is too much C, and particularly when co-existing with Cr, the Cr carbide separates at the grain boundary, causing

¹ [Translator's note: Braces indicate sections subject to the amendment following the patent added by the translator for ease of reference.]

grain boundary embrittlement, and the carbide dissolves and absorbs more Mo and W than the bare metal, so the reverse effects such as solution strengthening effects of the bare metal due to adding Mo and W are caused.

An alloy for a core metal according to the present invention differs from this sort of conventional alloys from a perspective of preventing partial melting damage to the core metal, and solid solution hardening is mainly used for mechanical strength at ordinary and high temperatures, so it is desirable to have as little contained C as possible. Nevertheless, when the quantity of contained C is too little, a need arises to increase the quantity of the contained Ni to maintain the required mechanical strength, and this is economically costly. Also, if the quantity of contained C is too little, the liquid fluidity decreases, and the castability thereby worsens.

For an alloy for core metal according to the present invention, the lower limit value of the quantity of contained C was set to {C} 0.1% from the aforementioned {B} perspective of economy and castability, and the upper limit value was set to {D} 0.25% from the {D} perspective of preventing partial melting damage to the core metal for piercing. {E}

Si is added as a general deoxidizer to alloys according to need to adjust the deoxidation of the alloy, but if there is too much Si, the toughness of the alloy decreases, and fayalite (FeO·SiO₂) is generated in the scale, embrittling it during general scale attachment performed to cause a fine scale having heat insulation and lubrication to attach to the surface of the core metal for piercing.

Thus, the upper limit value for the quantity of contained Si was fixed at 1.5%. There is no particular limitation on the lower limit.

Mn is also added to alloys as a general deoxidizer according to need to adjust the deoxidation of the alloy. When there is too much Mn, the scale is embrittled as with the case of Si.

Thus, the upper limit value for the quantity of contained Mn was fixed at 1.5%. There is no particular limitation on the lower limit.

The comparative rhythm [sic]² of Cr and Ni is important, so the reason for the range limitation of the Cr and Ni components is given together.

Cr is an effective element for increasing the mechanical strength at ordinary and high temperatures as well as increasing the resistance to oxidation of an alloy when it is melted in the bare metal or combined with C to form a carbide. Nevertheless, when the quantity of contained Cr is too high, the thickness of the scale layer generated during general scale attachment to cause a scale having heat insulation and lubrication to attach to the surface of the core metal become thinner due to an increase in the oxidation resistance, and, of the damage described above which is caused to the core metal, galling due to seizure of the pipe material occurs frequently. Further, if the quantity of contained Cr is too low, the mechanical strength of the alloy at ordinary and high temperatures is decreased, and abrasion, wrinkles and cracks occur due to insufficient strength in the core metal.

Ni is a useful element for dissolving entirely in the bare metal without forming a carbide with C, and increasing the mechanical strength at ordinary and high temperatures due to solid solution hardening. However, the price of Ni is high compared to Cr, so increasing the mechanical strength of the alloy at ordinary and high temperatures with only Ni is costly, and a mechanical strength cannot be obtained that is as high as when coexisting with Cr. The adverse effects of the attachment scale layer becoming thinner due to scale attachment are far less with adding Ni than with adding Cr.

Accordingly, adequate mechanical strength at ordinary and high temperatures as well as a scale layer with an appropriate thickness was given to the core metal alloy, and in order to maintain economy for the alloy, the mechanical strength at ordinary and high temperatures was supplemented and the quantity of added Ni was reduced by making Ni which can increase the mechanical strength without thinning the scale layer the main component and adding thereto Cr within the tolerable limit.

From the aforementioned perspective, the upper limit of the quantity of contained Cr was set to 3% so as to not thin the thickness of the scale layer, and the lower limit was set to 1% to supplement the

² [Translator's note: "comparative rhythm" is a typographical error for "proportion" in the Japanese source.]

mechanical strength. The quantity of contained Ni was fixed at three times the quantity of Cr, or in other words, the value of the ratio of Ni/Cr was 1 to 3, in order to increase the mechanical strength.

The basis for fixing the Ni/Cr ratio value of 1 to 3 is next described using the set of curved line drawings Fig. 1 and Fig. 2 and the set of drawings Fig. 3 and Fig. 4. Fig. 1 is a curved line drawing indicating the effects of the Ni/Cr ratio on the mechanical strength of an alloy at ordinary temperature when the quantity of contained Cr is 1.4%; Fig. 2 is a curved line drawing similarly with the effects at the same temperature of 900° C; Fig. 3 is a curved line diagram similarly with the effects at ordinary temperature when the quantity of contained Cr is 2.8%; and Fig. 4 is a curved line diagram similarly with the effects at the same temperature of 900°C.

As can be seen from these curved line diagrams, the pulling strength and elongation percentage at the ordinary temperature needed to prevent cracking, one of the damages causing lowering of the duration of core metal for piercing, is ill-suited for preventing cracks when the Ni/Cr ratio is less than 1 as the pulling strength is inadequate at 45 to 50 kg/mm², and when the Ni/Cr ratio is more than 3 as the elongation percentage is lowered markedly. Also, it can be seen that the pulling strength at high temperatures necessary for preventing abrasion and wrinkles on the surface of the core metal, another type of damage, is inadequate at 5.2 or 5.3 kg/mm² when the Ni/Cr ratio is more than 3, and the elongation percentage is markedly decreased.

A determination was made from the above results to fix the selection of the value of the Ni/Cr ratio in a core metal alloy according to the present invention to a range of 1 to 3.

Mo and W are effective elements for increasing the mechanical strength of alloys particularly at high temperatures by being dissolved in an alloy bare metal or being combined with C to form a carbide. On the other hand, increasing the quantity of contained Mo and W makes the scale layer generated so as to be attached to the surface of the core metal through scale attachment fragile. An example of the effects of adding Mo and W on the high temperature mechanical properties of a core metal alloy according to the present invention is shown in Fig. 5. This curved line drawing indicates the effect on the pulling strength and elongation percentage of the alloy caused by a change in the total quantity of Mo, W or both at a testing temperature of 900°C with a Ni/Cr ratio of 2.0 and a CR volume of 2.8%.

According to this curved line diagram, there is no effect of increasing the high temperature pulling strength until the total additive quantity of either one or two of Mo and W is 0.2%. However, with an additive quantity of 0.3% to 1.5%, the pulling strength gradually increases with the increase in the additive quantity, and with an additive quantity of 1.5 to 2.0%, the pulling strength increases rapidly with the increase in the additive quantity. At more than 2.0%, it can be seen that the pulling strength once again changes to a gradual increase.

With a core metal manufactured according to an alloy of the present invention, when piercing a solid round steel billet heated to approximately 1200°C, if the billet material being pierced is simply carbon steel, a core metal for piercing according to an alloy of the present invention having an additive quantity of less than 1.5% of a total of one or two of Mo and W adequately exceeds the durability of a conventional core metal. However, for a special steel such as when the material of the steel billet to be pierced is 13% chrome steel or 24% chrome steel, an additive quantity of a total of one or two of Mo and W of 1.5% to 3.0% is required.

Accordingly, the additive quantity of a total of one or two of Mo and W in an alloy according to the present invention was fixed at 0.3 to 3%.

Co is an element added to low alloy steels such as a core metal alloy according to the invention or a general carbon steel which is unique for lowering the hardenability of steel.

A core metal for piercing is pressed in a solid round billet heated to approximately 1200°C, so the surface temperature of the core metal for piercing immediately after piercing becomes approximately 1200°C to 1300°C, from the surface to approximately 5 mm inside becomes approximately 800°C, and the inside becomes less than 700°C.

A core metal heated to such a state is cooled to ordinary temperature with water immediately after piercing, and is then pressed again in a new billet; such heating and cooling is repeated in this manner. Through such repetitions, thin tortoise shell type cracks occur in the surface of the core metal, and this causes rolling marks to occur on the inside surface of the pierced pipe. Such tortoise shell type cracks originate in heat stress caused mainly due to the repeated heating and cooling.

In general, the heat stress of a steel body with a low hardenability and no quenching abnormalities causes compression stress at the surface of the steel body and pulling stress at the center of the steel body. In contrast to this, the heat stress of a steel body with a high hardenability and with quenching abnormalities causes pulling stress in the surface and compression stress at the center. In other words, the distribution of the heat stress switches. In general, repeatedly heating and cooling without compression stress becoming quenching abnormalities in the surface leads to less tortoise shell cracks.

The cross-section hardness of a round bar steel billet is measured after it is quenched in water, and the size of the hardenability can be expressed as the ratio d/r where d is the thickness of the hardened layer whose hardness is 40 or higher on the Rockwell C scale and r is the radius of the round bar. In other words, the smaller the d/r value, the lower the hardenability.

An example of the effect the quantity of the contained Co component has on the d/r value when a round bar with a radius of 25 mm according to an alloy of the present invention is quenched in water is shown in a curved line diagram of Fig. 6. From this curved line diagram, it can be seen that the lowering of the hardenability is remarkable until Co reaches 1.75%, and that the effects decrease when Co exceeds 1.75%.

Thus, the lower limit of the additive quantity of Co in an alloy of the present invention was set at 1% from the viewpoint of the effects of hardenability lowering, and the upper limit was set to 2% from a perspective that little hardening lowering effects are obtained for the economic increase in cost.

Cu is an effective element for being minutely separated in bare metal and increasing the pulling strength at ordinary temperatures. It is also an effective element for improving the adhesion to bare metal for the scale, enriched by the bare metal directly under the scale during attachment of a scale having heat insulation and lubrication as described above. If the additive quantity is below 1%, however, the improvement of the pulling strength at ordinary temperatures is low, and if the additive quantity is too high, the Cu enriched directly under the scale permeates into the crystal grain boundary of the bare metal at high temperatures, making the surface layer of the core metal fragile.

Thus, the lower limit of the additive quantity of Cu for an alloy of the present invention was set to 1%, and the upper limit was set to 2%.

With a preference over Cr, Ti and Zr are combined with C to form a carbide. Unlike a Cr carbide, a Ti and Zr carbide has a uniform distribution in the bare metal, and the solubility in bare metal at high temperatures is extremely low compared to a Cr carbide, so Ti and Zr are effective elements for lowering the partial melting point of the grain boundary and reducing the embrittlement of the grain boundary as well as increasing the pulling strength at high temperatures. Further, as a result of the decrease in the quantity of Cr carbide because precedence is made for Ti and Zr over Cr in forming the carbide, the Cr, W and Mo absorbed in the Cr carbide is decreased, the concentrations of these elements in the bare metal are accordingly increased, and the pulling strength of the alloy at high temperatures due to solid solution hardening improves. Nevertheless, if the additive quantity of Ti and Zr is too large, the liquid fluidity is markedly decreased when dissolving the alloy in air, and the castability when manufacturing the core metal is impaired.

Thus, the upper limit of the additive quantity of a total of either one or two types of Ti and Zn [illegible, r?] for an alloy of the present invention was fixed at 0.5% and the upper limit at 0.2%.

A core metal alloy for piercing a seamless pipe was described above; because a description for a core metal alloy for such expansion is exactly the same as that for a core metal alloy for piercing, it has been omitted.

Next, an embodiment is described.

The compositions of embodiments of core metal alloys for piercing according to the prevent invention are indicated in Table 1. The compositions of alloys according to the antecedent Patent Application Number S59-11899 [i.e., 1984-11899] invention as well as conventionally known types of alloys are also given alongside.

A number 10 ordinary temperature pulling test piece according to specification number JIS-Z-2201, a high temperature pulling test piece according to specification number JIS-G-0567, as well as piercing core metals for an Assel mill with diameters of 69 m/m, 72 m/m and 75 m/m were manufactured as raw materials for the alloys of the compositions indicated in Table 1. High temperature pulling tests were performed with a 5% strain rate every minute at a temperature of 900°C. Using these core metals, piercing tests of two types (C approximately 1% and Cr approximately 1.5%) of actual JIS SUJ bearing steel material (so-called high carbon chrome bearing steel material) were performed using the Assel mill. The results of these tests are indicated in Table 2. The durability of the core metal is indicated with the average number of piercing holes per core metal for piercing.

As seen in Table 2, the mechanical strength at ordinary and high temperatures of alloys according to the present invention is between 1.5 and 3 times that of conventionally known types of alloys, and it can be seen that it is equivalent or somewhat higher than that of the alloys in the Patent Application Number S59-11899 [i.e., 1984-11899] invention. The durability of a core metal manufactured with the alloy of the present invention is sent to be between 2 and 5 times that of a known alloy and from between 1.5 and 2 times that of the alloys of the Patent Application Number S59-11899 [i.e., 1984-11899] invention. The increase in the durability of the core metals according to alloys of the present invention is due to the effects of the tortoise shell cracks in the surface of the core metal decreasing due to the addition of Co to the alloy, the adhesion of a scale due to the addition of Cu, and the prevention of grain boundary separation of the carbide due to the addition of Ti and Zr.

5. Voluntary amendment

[impression of a seal, mostly illegible] 2 [= Feb?] 1985

6. Object of the amendment

Specification

- 7. Details of the amendment
 - (1) Correct the entire specification of the Scope of Claims as follows.
 - (2) Make the below corrections in the Specification.
 - A. 9 lines from the bottom of page 4, correct "0.1 to 0.25% C" to "0.14 to 0.18% C".
 - B. The last line on page 6, correct "perspectives" to "experimental perspectives".
 - C. Page 7 line 1, correct "0.1%" to "0.14%".
 - D. Same page line 2, correct "perspective" to "experimental perspective." Correct "0.25%" in that same line to "0.18%".
 - E. Same page line 3, insert "(refer to the embodiments given below)" after "piercing."
 - F. Correct Table 1 and Table 2 on pages 19 and 20 as in the attached pages.

2. Claims

1. A core metal alloy for piercing or expanding [insertion] a [end insertion] seamless steel pipe made from, by weight, 0.14 to 0.18% C, 1 to 3% Cr, 1 to 9% Ni, 0.3 to 3% of a total of one or two types of Mo and W, 1 to 2% of Co, 1 to 2% of Cu, 0.2 to 0.5% of a total of one or two types of Ti and Zr, and the balance Fe with inevitable trace quantities of impurities, and a weight ratio value for Ni/Cr of between 1 and 3.

Well-known alloys]
2 3 Cr-1 Ni cast copper]

^{[*3 1.5} Cr-0.75 Ni cast copper]

2. A core metal alloy recited in Claim 1 characterized by the fact of further containing, by weight, according to need 1.5% or less of Si and/or 1.5% or less of Mn and as a deoxidizer.
